Rails 最佳實務

http://ihower.tw
2016/4

Agenda

- Concept: What's good code?
- Move Code from Controller to Model
- Model best practices
- Controller best practices
- View best practices
- Next

Warning! you should have testing before modify!

修改重構程式前，

應有自動化測試

確保程式於修改後行為不變

Best Practice Lesson 0:

Concepts

Why best practices?

- Large & complicated application
  日漸複雜的程式
- Team & different coding style
  團隊開發

Your code become...

- 僵硬 (Rigidity)：難以修改，每改一處牽一髮動全身
- 脆弱 (Fragility)：一旦修改，別的無關地方也炸到
- 固定 (Immobility)：難以分解，讓程式再重用
- 黏滯 (Viscosity)：彈性不夠，把事情做對比做錯還難
- 不需要的複雜度 (Needless Complexity)：過度設計沒直接好處的基礎設施
- 不需要的重複 (Needless Repetition)：相同概念的程式碼被複製貼上重複使用
- 晦澀 (Opacity)：難以閱讀，無法了解意圖

出自 Agile Software Development: Principles, Patterns, and Practices 一書

We need good code:

我們需要好程式

What's Good code?

- Readability 易讀，容易了解
- Flexibility 彈性，容易擴充
- Effective 效率，撰碼快速
- Maintainability 維護性，容易找到問題
- Consistency 一致性，循慣例無需死背
- Testability 可測性，元件獨立容易測試

So, What we can do?

來開始學幾招吧

Best Practice Lesson:

Move code from Controller to Model

action code 超過15行請注意

http://weblog.jamisbuck.org/2006/10/18/skinny-controller-fat-model

Before

1.Move finder to scope

```
class PostsController < ApplicationController

  def index
    @public_posts = Post.where(:state => 'public' ).limit(10)
                        .order('created_at desc')
    @draft_posts  = Post.where(:state => ‘draft').limit(10)
                        .order('created_at desc')
  end

end
```

After

1.Move finder to scope

```
class UsersController < ApplicationController

  def index
    @published_post = Post.published
    @draft_post = Post.draft
  end

  end

  class Post < ActiveRecord::Base

    scope :published, -> { where(:state => ‘published').limit(10)
                           .order('created_at desc') }
    scope :draft, -> { where(:state => ‘draft').limit(10)
                       .order('created_at desc') }

  end
```

Before

2. Use model association

```
class PostsController < ApplicationController

  def create
    @post = Post.new(params[:post])
    @post.user_id = current_user.id
    @post.save
  end

end
```

After

2. Use model association

```
class PostsController < ApplicationController

  def create
    @post = current_user.posts.build(params[:post])
    @post.save
  end

end

class User < ActiveRecord::Base
  has_many :posts
end
```

3. Use scope access

不必要的權限檢查

Before

```
class PostsController < ApplicationController

  def edit
    @post = Post.find(params[:id)

    if @post.user != current_user
      flash[:warning] = 'Access denied'
      redirect_to posts_url
    end

  end

end
```

3. Use scope access

找不到自然會丟例外

After

```
class PostsController < ApplicationController

  def edit
    # raise RecordNotFound exception (404 error) if not found
    @post = current_user.posts.find(params[:id)
  end

end
```

Before

4. Add model virtual attribute

```
<% form_for @user do |f| %>
    <%= text_filed_tag :full_name %>
<% end %>

class UsersController < ApplicationController
  def create
    @user = User.new(params[:user)
    @user.first_name = params[:full_name].split(' ', 2).first
    @user.last_name = params[:full_name].split(' ', 2).last
    @user.save
  end

end
```

After

4. Add model virtual attribute

```ruby
class User < ActiveRecord::Base

  def full_name
    [first_name, last_name].join(' ')
  end

  def full_name=(name)
    split = name.split(' ', 2)
    self.first_name = split.first
    self.last_name = split.last
  end

end
```

example code from http://railscasts.com/episodes/16-virtual-attributes

After

```erb
<% form_for @user do |f| %>
  <%= f.text_field :full_name %>
<% end %>
```

```ruby
class UsersController < ApplicationController

  def create
    @user = User.create(params[:user)
  end

end
```

example code from http://railscasts.com/episodes/16-virtual-attributes

5. Use model callback

Before

```
<% form_for @post do |f| %>
  <%= f.text_field :content %>
  <%= check_box_tag 'auto_tagging' %>
<% end %>

class PostController < ApplicationController

  def create
    @post = Post.new(params[:post])

    if params[:auto_tagging] == '1'
      @post.tags = AsiaSearch.generate_tags(@post.content)
    else
      @post.tags = ""
    end

    @post.save
  end

end
```

After

5. Use model callback

```
class Post < ActiveRecord::Base

  attr_accessor :auto_tagging
  before_save :generate_taggings

  private

    def generate_taggings
      return unless auto_tagging == '1'
      self.tags = Asia.search(self.content)
    end

end
```

After

```
<% form_for :note, ... do |f| %>
  <%= f.text_field :content %>
  <%= f.check_box :auto_tagging %>
<% end
```

```
class PostController < ApplicationController
  def create
    @post = Post.new(params[:post])
    @post.save
  end

end
```

6. Replace Complex Creation with Factory Method

Before

```
class InvoiceController < ApplicationController

  def create
    @invoice = Invoice.new(params[:invoice])
    @invoice.address = current_user.address
    @invoice.phone = current_user.phone
    @invoice.vip = ( @invoice.amount > 1000 )

    if Time.now.day > 15
      @invoice.delivery_time = Time.now + 2.month
    else
      @invoice.delivery_time = Time.now + 1.month
    end

    @invoice.save
  end

end
```

After

6. Replace Complex Creation with Factory Method

```
class Invoice < ActiveRecord::Base

  def self.new_by_user(params, user)
    invoice = self.new(params)
    invoice.address = user.address
    invoice.phone = user.phone
    invoice.vip = ( invoice.amount > 1000 )

    if Time.now.day > 15
      invoice.delivery_time = Time.now + 2.month
    else
      invoice.delivery_time = Time.now + 1.month
    end
    return invoice
  end

end
```

After

```
class InvoiceController < ApplicationController
  def create
    @invoice = Invoice.new_by_user(params[:invoice], current_user)
    @invoice.save
  end
end
```

Before

7. Move Logic into the Model

```
class PostController < ApplicationController

  def publish
    @post = Post.find(params[:id])
    @post.is_published = true
    @post.approved_by = current_user
    if @post.create_at > Time.now - 7.days
      @post.popular = 100
    else
      @post.popular = 0
    end
    @post.save

    redirect_to post_url(@post)
  end

end
```

7. Move Model Logic into the Model

After

```
class Post < ActiveRecord::Base

  def publish(user)
    self.is_published = true
    self.approved_by = user
    if self.create_at > Time.now-7.days
      self.popular = 100
    else
      self.popular = 0
    end
  end

end
```

After

```
class PostController < ApplicationController

  def publish
    @post = Post.find(params[:id])
    @post.publish(current_user)
    @post.save

    redirect_to post_url(@post)
  end

end
```

Best Practice Lesson:

Model

Before

1. the Law of Demeter

```
class Invoice < ActiveRecord::Base
  belongs_to :user
end

<%= @invoice.user.name %>
<%= @invoice.user.address %>
<%= @invoice.user.cellphone %>
```

After

1. the Law of Demeter

```
class Invoice < ActiveRecord::Base
  belongs_to :user
  delegate :name, :address, :cellphone, :to => :user,
                                        :prefix => true,
                                       :allow_nil => true
end
```

```
<%= @invoice.user_name %>
<%= @invoice.user_address %>
<%= @invoice.user_cellphone %>
```

2. DRY: Metaprogramming

Before

```
class Post < ActiveRecord::Base

  validate_inclusion_of :status, :in => ['draft', 'published', 'spam']

  def self.all_draft
    where( :status => 'draft'  )
  end

  def self.all_published
    where( :status => 'published' )
  end

  def self.all_spam
    where( :status => 'spam' )
  end

  def draft?
    self.status == 'draft'
  end

  def published?
    self.status == 'published'
  end

  def spam?
    self.status == 'spam'
  end

end
```

2. DRY: Metaprogramming

After

```
class Post < ActiveRecord::Base

  STATUSES = ['draft', 'published', 'spam']
  validate_inclusion_of :status, :in => STATUSES

  class << self
    STATUSES.each do |status_name|
      define_method "all_#{status}" do
        where( :status => status_name )
      end
    end
  end

  STATUSES.each do |status_name|
    define_method "#{status_name}?" do
      self.status == status_name
    end
  end

end
```

Breaking Up Models

幫 Model 減重

Before

3. Extract into Module

```ruby
class User < ActiveRecord::Base

  validates_presence_of :cellphone
  before_save :parse_cellphone

  def parse_cellphone
    # do something
  end

  def self.foobar
    # do something
  end

end
```

After

```ruby
# /app/models/concerns/has_cellphone.rb
module HasCellphone

  def self.included(base)
    base.validates_presence_of :cellphone
    base.before_save :parse_cellphone

    base.send(:extend, ClassMethods)
  end

  def parse_cellphone
    # do something
  end

  module ClassMethods
    def foobar
      # do something
    end
  end

end
```

Or use http://api.rubyonrails.org/classes/ActiveSupport/Concern.html

After

```
class User < ActiveRecord::Base
  include HasCellphone
end
```

4. save v.s. save!

- 有搭配 if … else 情況做處理用 save。這表示你會處理儲存失敗流程
- 沒有的話，用 save! 驚嘆號版本。這表示你認為 99% 應該會存成功，懶得處理存不成功。如果出錯會有例外通知

Best Practice Lesson:

Migration

Before

1. Isolating Seed Data

```
class CreateRoles < ActiveRecord::Migration
  def self.up
    create_table "roles", :force => true do |t|
      t.string :name
    end

    ["admin", "author", "editor","account"].each do |name|
      Role.create!(:name => name)
    end
  end

  def self.down
    drop_table "roles"
  end
end
```

After

1. Isolating Seed Data

```
# /db/seeds.rb
["admin", "author", "editor","account"].each do |name|
  Role.create!(:name => name)
end
```

```
rake db:seed
```

Before

2. Always add DB index

```
class CreateComments < ActiveRecord::Migration
  def self.up
    create_table "comments", :force => true do |t|
      t.string :content
      t.integer :post_id
      t.integer :user_id
    end
  end

  def self.down
    drop_table "comments"
  end
end
```

After

2. Always add DB index

```
class CreateComments < ActiveRecord::Migration
  def self.up
    create_table "comments", :force => true do |t|
      t.string :content
      t.integer :post_id
      t.integer :user_id
    end

    add_index :comments, :post_id
    add_index :comments, :user_id
  end

  def self.down
    drop_table "comments"
  end
end
```

Best Practice Lesson:

Controller

1. Use before_action

Before

```
class PostController < ApplicationController

  def show
    @post = current_user.posts.find(params[:id]
  end

  def edit
    @post = current_user.posts.find(params[:id]
  end

  def update
    @post = current_user.posts.find(params[:id]
    @post.update_attributes(params[:post])
  end

  def destroy
    @post = current_user.posts.find(params[:id]
    @post.destroy
  end

end
```

1. Use before_action

After

```
class PostController < ApplicationController

  before_action :find_post, :only => [:show, :edit, :update, :destroy]

  def update
    @post.update_attributes(params[:post])
  end

  def destroy
    @post.destroy
  end

  protected

  def find_post
    @post = current_user.posts.find(params[:id])
  end

end
```

http://jeromedalbert.com/how-dhh-organizes-his-rails-controllers/

Best Practice Lesson:

View

最重要的守則：

Never logic code in Views

1. Move code into controller

Before

```
<% @posts = Post.all %>
<% @posts.each do |post| %>
 <%=h post.title %>
 <%=h post.content %>
<% end %>
```

After

```
class PostsController < ApplicationController

  def index
    @posts = Post.all
  end

end
```

2. Move code into model

Before

```
<% if current_user && (current_user == @post.user ||
                       @post.editors.include?(current_user) %>
  <%= link_to 'Edit this post', edit_post_url(@post) %>
<% end %>
```

After

```
<% if @post.editable_by?(current_user) %>
  <%= link_to 'Edit this post', edit_post_url(@post) %>
<% end %>
```

```
class Post < ActiveRecord::Base
  def ediable_by?(user)
    user && ( user == self.user || self.editors.include?(user)
  end
end
```

3. Move code into helper

Before

```
<%= select_tag :state, options_for_select( [[t(:draft),"draft" ],
                                            [t(:published),"published"]],
                                           params[:default_state] ) %>
```

After

```
<%= select_tag :state, options_for_post_state(params[:default_state]) %>

# /app/helpers/posts_helper.rb
def options_for_post_state(default_state)
  options_for_select( [[t(:draft),"draft" ],[t(:published),"published"]],
                      default_state )
end
```

4. Replace instance variable with local variable

```ruby
class Post < ApplicationController
  def show
    @post = Post.find(params[:id)
  end
end
```

Before

```
<%= render :partial => "sidebar" %>
```

After

```
<%= render :partial => "sidebar", :locals => { :post => @post } %>
```

6. Organize Helper files

Before

```
# app/helpers/user_posts_helper.rb
# app/helpers/author_posts_helper.rb
# app/helpers/editor_posts_helper.rb
# app/helpers/admin_posts_helper.rb
```

After

```
# app/helpers/posts_helper.rb
```

7. Learn Rails Helpers

- Learn content_for and yield
- Learn how to pass block parameter in helper
  - my slide about helper: http://www.slideshare.net/ihower/building-web-interface-on-rails
- Read Rails helpers source code
  - /actionpack-x.y.z/action_view/helpers/*

View Component

改善 partial template 封裝問題

Coding Style

http://guides.ruby.tw/ruby-rails-style-guides/

- 靜態程式碼分析工具 (static code analyzer)
  - https://github.com/bbatsov/rubocop
  - https://github.com/troessner/reek
  - https://github.com/railsbp/rails_best_practices
  - 第三方服務 https://houndci.com/
  - 第三方服務 https://codeclimate.com
- Coding style 是面試看 code 的第一印象，很容易可以看出你是不是初學者，常不常寫 code。
  - 可讀的變數命名、適當縮排和空格

Next decompose fat model!
(其中 service object 最常用)

- http://blog.codeclimate.com/blog/2012/10/17/7-ways-to-decompose-fat-activerecord-models/
- http://pivotallabs.com/object-oriented-rails-writing-better-controllers/
- https://www.viget.com/articles/slimming-down-your-models-and-controllers

Kent Beck 的四個簡單程式設計原則

- Pass All Tests 通過全部測試
- Reveals Intent (Self-Documenting Code) 程式能夠表達出意圖
  - Composed Method
- No Duplication (DRY) 不重複
- Has no superfluous parts (Minimizes the number of classes and methods) 不多餘
